

DOUBLING & HALVING MASTER	FLEXIBLE THINKING ADDITION MASTER	FACTOR MASTER	PARTITIONING MASTER	SUBTRACTION MASTER	BALANCED EQUATIONS
<p>Being able to use strategies to halve and double two and three digit numbers. Seeing doubling and halving as the inverse (opposite) of each other.</p> <p>Example: Half of 50 = Half of 200= Double 20 =40 Double 200=400</p>	<p>Adding numbers to 100 using a range of strategies:</p> <ul style="list-style-type: none"> • Doubles • Near doubles • 10s facts • Place Value/partitioning • When adding a 9 to a number take one from the other side. <p>Students should be able to use and explain flexible thinking strategies for each question.</p> <p>Example: 13+7=? 3+7 is 10 plus one more group of 10 makes 20 Or 50+60 is double 50 and 10 more.</p>	<p>Using the factors of the 2s, 5s, and 10s times tables.</p> <p>This Master skill is to be completed with manipulatives. This skill is where students begin to make the link between X and \div being inverse (opposites).</p> <p>Explore divisibility and 'groups of' that can be made using numbers that are multiples of 2, 5 or 10.</p> <p>25 can be shared into 5 equal groups of 5. 30 can be shared into 3 groups of 10. How many will I have altogether if I have 3 groups of 2?</p>	<p>Partition the number 100 in 5 different ways. (shows number flexibility)</p> <p>STEP2: Using Place Value knowledge to partition two digit numbers in order to mentally add them.</p> <p>Example: Adding 36+24 30+20=50 6+4=10 TOTAL: 50+10=60</p> 	<p>Completing simple subtraction problems mentally using a range of strategies</p> <ul style="list-style-type: none"> • Inverse operation fact eg 10-3=? I know 3+7=10 so the answer is 7. • Known doubles/halves facts • Partitioning/Place Value <p>Example: 10-7=? 20-5=? 9-4=? 100-50= 15-3= 30-15= 75-15=</p>	<p>Use knowledge of inverse operation +/- and number facts, with numbers up to 50. eg 10+3=5+?</p> <p>Understand the = sign means "the same as"</p> <p>Example: 13+6=30-? 15+?=20+2 25+?=50-?</p> 
<p>Ideas: Halving is the opposite of doubling. X2 means 2 groups of or 'double' a number. $\div 2$ means to halve a number</p> <p>Make connections with single digit halving facts the students know. For example if you know half of 20 is 10 then what is half of 200?</p> <p>Practice important halving facts we use in everyday life eg half of 50 is 25, half of 30 is 15</p>	<p>Ideas: Review doubles, near doubles, 10s facts, the +9 rule (9+3 can be seen as 10+2) and partitioning numbers using place value.</p> <p>Ask/write questions using numbers to 100 that lend themselves to one of the above strategies. 30+30= 50+60= 16+4= 28+9= 57+43= When solving these questions, use language such as "50 and 60 is like doubling 50 and then adding 10 more".</p>	<p>Ideas: Practise this skill using a combination of multiplication and division facts highlighting how each fact family uses the same numbers organised in different ways. 12\div2=6 12\div6=2 6x2=12 2x6=12</p> <p>Use a combination of X/\div and language such as Groups of, shared between, equal groups and groups of to discuss these facts.</p>	<p>Ideas: Think of as many ways as you can to break up 100. Use materials and real life situations to explore this skill.</p> <p>Use MAB, icy pole sticks, tens and ones</p> <p>Explore ways to break up 2-digit numbers into tens and ones. Discuss how using this skill makes it easy to quickly add 2 digit numbers mentally in your head. Eg 23+62 20+60= 80 3+2 =5 80+5</p>	<p>Ideas: Review doubles, near doubles, 10s facts, partitioning numbers using place value.</p> <p>Ask/write questions using numbers to 100 that lend themselves to one of the above strategies. 10-7=? 20-5=? 25-5= 9-4=? 100-50= 15-3= 100-5= 30-15= 75-15=</p>	<p>Ideas: use materials, diagrams and number lines; for example, using number lines to demonstrate that 5 + 2 = 2 + 5, and demonstrating that 2 + 2 + 3 = 7 and 2 + 3 + 2 = 7 and 3 + 2 + 2 = 7</p> <p>Flip 3 cards and use add/sub operations to create an unbalanced equation, then use inverse operations to make the equation balanced. Eg. 8-? = 2 + 4</p> <p>Using a combination of 20, 12 and 6-sided dice, create larger unbalanced equations (up to 50). Eg. 19+7 = 42-?</p>
